Clinical information REQUIRED

ALL fields must be completed for testing to proceed.

Please note: Requested clinical information is essential for test accuracy. If any of the clinical information you provide below changes, please notify the laboratory immediately as this information is included in the test algorithm.

GESTATIONAL AGE

Either Weeks ____ Days ____ as at ____ / ____ / ____ (date)
 or LMP EDC IVF ____ / ____ / ____ (date)

CONCEPTION DETAILS

Natural IVF (Patient egg) | Maternal age at egg retrieval ____ yrs
 IVF (Donor egg) | Maternal age at egg retrieval ____ yrs

MATERNAL INFORMATION

Maternal weight (kg) _____ Maternal height (cm) _____

Harmony Prenatal Test is not validated for three or more fetuses, or in the presence of a demised fetus. The Harmony Prenatal Test examines for certain aneuploidies in viable singleton and twin pregnancies by natural or IVF conception after 10 weeks' gestation.

22q11.2 may be added as an extra test, for an additional fee, within 14 days of the trisomy report. Specific exclusions are detailed at www.sonicgenetics.com.au. Please note that the requested clinical information is essential for test accuracy.

Requesting doctor

FOR THE PATIENT - Patient Consent

I consent to the Harmony Prenatal Test being performed and confirm that I have been informed about the purpose, scope and limitations of the test. Sources of information that I can access include my doctor, the Sonic Genetics website and brochures, a genetic counsellor and the reverse of this request form. I have had the opportunity to ask questions and understand that I can request further information or genetic counselling before or after the test.

I understand that the test is a screen for an extra copy of chromosomes 21, 18 and 13, that the test can also optionally identify fetal sex, screen for microdeletions of 22q11.2 and changes in the number of sex chromosomes, that the result should be reviewed by my doctor in the light of other findings, that a 'high probability' result should be confirmed by fetal karyotype, that a second collection may be required, and that 1-2% of tests do not yield a result due to biological factors. Should there be no result for chromosomes 21, 18, and 13, plus 22q11.2 if requested, a refund is available.

I consent to my result being used with Government birth records solely to audit the Harmony test, and understand that I would not be identified in reports of such audits.

Tick here if you do not consent to releasing your result for audit purposes.

Signature **PATIENT SIGNATURE** Date _____

Collection appointment and payment

Full payment is required prior to sample collection and **Medicare benefits do not apply.**

Non-invasive prenatal testing (NIPT) requires a pre-booked collection appointment.

Please call (07) 3377 8747 to pay and complete your booking. You will need to have this form at hand. Please make sure you bring this form with you on the day. If you have any queries, please call our Patient Services Support Centre team on (07) 3377 8747.

Please record your payment receipt number here: _____

FOR THE COLLECTOR

I certify I established the identity of the patient named on this request, collected and immediately labelled the accompanying specimen(s) with the patient's name, DOB and date/time of collection.

Purpose

The primary purpose of Harmony is to screen for common chromosome disorders which can affect the health of a baby, i.e. Down syndrome (trisomy 21), Edwards syndrome (trisomy 18), and Patau syndrome (trisomy 13), plus microdeletions of chromosome 22, if requested (22q11.2). Harmony can also screen for common disorders of the sex chromosomes, i.e. Turner syndrome (45,X), Klinefelter syndrome (47,XXY), Triple X syndrome (XXX) and Jacobs syndrome (47,XYY) in singleton pregnancies. Harmony is not primarily intended as a test of fetal sex.

Limitations

There are rare occasions in which an NIPT result is incorrect. All NIPTs rely on fragments of DNA found in the mother's bloodstream; these fragments come from the placenta. On rare occasions, the DNA status of the placenta may not be the same as that of the fetus and, as a result, the NIPT result may not reflect the actual situation in the developing baby. For that reason, an NIPT result should be carefully reviewed by your doctor, together with other information about your pregnancy before basing any decision on that result. Please also note that NIPT is a test for the conditions noted above; it is not a test for every possible fetal disorder. These considerations apply to any form of NIPT; they are not specific to Harmony.

Fetal fraction

The quantity of fetal (placental) DNA circulating in the mother's bloodstream is known as the fetal fraction. During the first 10 weeks of pregnancy, the fetal fraction is too low for NIPT to be reliable. For this reason, we do not offer Harmony before 10 weeks' completed gestation. Numerous factors, including high maternal weight, can lower the fetal fraction, even after the 10th week of pregnancy. Harmony also measures the fetal fraction in your blood sample, and will not provide a result unless there is sufficient fetal DNA to provide a reliable result for trisomy 13, 18 or 21, or 22q11.2 deletion, if requested. In this situation, we will not assume that your test result is normal, and you may be offered a repeat test (once) at no additional charge; if the second collection is also unreportable, we will refund the cost of your test on request.

Fetal sex and sex chromosomes

For biological reasons, it is more difficult to count the numbers of sex chromosomes (X and Y) than other chromosomes. We do not routinely report fetal sex or analysis of sex chromosomes, but will do so at no additional charge on request. Please note that the request should be made by your doctor on the initial request form and is only available for singleton pregnancies.

In less than 1% of samples, a definite result can be provided regarding the chance of trisomy 13, 18 or 21 (and 22q11.2 deletion, if requested) but not for fetal sex or sex chromosome disorders (or both). The fetal fraction in these samples is often at the low end of the acceptable range. Other factors may also make it difficult to provide accurate sex chromosome analysis, including poor quality of DNA in the sample, uncommon normal variations in the sex chromosomes, and a mixture of normal and abnormal cells in the placenta or mother. In these situations, we will report that a result is not possible for fetal sex or screening for a sex chromosome abnormality. We do not recommend repeat testing as the biological factors responsible for the lack of a result are unlikely to have changed. We do not offer a refund, as the primary purpose of Harmony (screening for trisomy 13, 18 or 21, plus 22q11.2 deletion, if requested) has been achieved.

Genetic counselling

Various forms of prenatal screening tests have been available in Australia for more than 30 years. Your doctor will be able to provide you with information and advice regarding this test, and can help you decide if this is the right test for you. Your doctor may also recommend that you seek genetic counselling before or after the test; we can provide contact details for genetic counselling services nationally.

If you have any questions regarding your test result, we recommend that you discuss these with your doctor or genetic counsellor. Your doctor will know your situation and have the results of other tests and assessments. Your doctor can also contact our senior scientists and genetic pathologists to discuss technical aspects of your result.

Results

Your results will be delivered to your doctor typically within 5-8 business days.

Sonic Genetics

We are part of Sonic Healthcare which is Australia's largest pathology provider and the third largest pathology provider in the world. We employ highly qualified genetic pathologists, genetic scientists and molecular biologists and operate out of fully accredited laboratories throughout Australia, using state-of-the-art equipment. The laboratory performing the test in Australia has achieved NATA accreditation specifically for the Harmony Prenatal Test.

Non-invasive prenatal testing based on cell-free DNA analysis is not diagnostic: results should be confirmed by diagnostic testing. Before making any treatment decisions, all women should discuss their results with their healthcare provider, who can recommend confirmatory, diagnostic testing where appropriate. The Harmony Prenatal Test was developed by Ariosa Diagnostics. Sonic Genetics performs the Harmony Prenatal Test in Australia at our NATA-accredited Sullivan Nicolaides Pathology (SNP) laboratory. The Harmony Prenatal Test is included on the Australian Register of Therapeutic Goods.
